Contents

- Present experimental status of the exotic mesons
 (1) X(3872)
 (2) Z(4430)[±]
 - (3) Other exotic mesons
- X(3872) as charmonium-hadronic molecule hybrid
- Possibility of other exotic hadrons by the same mechanism as X(3872)
- Are J/psi and psi(25) the charmonia?
- Summary

Experimental status of X(3872)

- First observation: 2003, Belle, KEKB cited more than 1000 times
- Mass: (3871.69 ± 0.17) MeV (J/ψ X decay mode)
 <u>about 0.11 MeV below</u> D⁰D^{*0} threshold
- Mass:3782.9(+0.6 -0.4)(+0.4 -0.5)MeV (D^{0bar}D^{0*} decay mode: D^{0*} mass constraind for off-shell D^{0*)}
- Width: less than 1.2 MeV
- Quantum Number: $J^{PC} = 1^{++} L = 0$

Experimental status of X(3872)

FIG. 1 (color online). Distribution of ΔM for $B^+ \rightarrow J/\psi K^+ \pi^+ \pi^-$ candidates. The fit of the X(3872) signal is displayed. The solid (blue), dashed (red) and dotted (green) lines represent the total fit, signal component and background component, respectively.

「チャームハドロンの構造と相互作用」KEK 東海キャンパス 2015/8/6

FIG. 5 (color online). Background-subtracted distribution of $\cos \theta_X$ for candidates with $|\cos \theta_\rho| > 0.6$ for the data (points with error bars) compared to the expected distributions for various $X(3872) J^{PC}$ assignments (solid histograms) with the B_{LS} amplitudes obtained by the fit to the data in the five-dimensional angular space. The fit displays are normalized to the observed number of the signal events in the full angular phase space.

Experimental status of Z(4430) ±

• First observation: 2008, Belle, KEKB $ar{B}^0 o \psi(2S) K^- \pi^+$

Invariant mass of $\psi(2S)\pi^+$ CCUd Mass: 4485 ± 22⁺²⁸-11 MeV (Belle 2013) Width: 200 +41-46 +26-35 MeV (Belle 2013)

- LHCb observation: 2014
 Mass: 4475 ± 7⁺¹⁵₋₂₅ MeV
 Width: 172 ± 13⁺³⁷₋₃₄ MeV
- Quantum number: 1+

Experimental status of Z(4430) ±

 $(100)^{2} = 200 \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^-}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0 < m_{K^*\pi^+}^2 < 1.8 \text{ GeV}^2 \right]^{100} \left[1.0$

FIG. 3 (color online). Fitted values of the Z_1^- amplitude in six $m_{\psi'\pi^-}^2$ bins, shown in an Argand diagram (connected points with the error bars, $m_{\psi'\pi^-}^2$ increases counterclockwise). The red curve is the prediction from the Breit-Wigner formula with a resonance mass (width) of 4475 (172) MeV and magnitude scaled to intersect the bin with the largest magnitude centered at (4477 MeV)². Units are arbitrary. The phase convention assumes the helicity-zero $K^*(892)$ amplitude to be real.

FIG. 4 (color online). Distribution of $m_{\psi'\pi^-}^2$ in the data (black points) for $1.0 < m_{K^+\pi^-}^2 < 1.8 \text{ GeV}^2$ [$K^*(892)$, $K_2^*(1430)$ veto region] compared with the fit with two, 0^- and 1^+ (solid-line red histogram) and only one 1^+ (dashed-line green histogram) Z^- resonances. Individual Z^- terms (blue points) are shown for the fit with two Z^- resonances.

表 1: Zc(4430)[±] 以降に発見された電荷又はアイソスピンを持ったチャーモニウム及びボトモニウム様状態

Summary of experimental status of exotic mesons (1)

- Only X(3872), Z(4430)[±], Z_c(3900)[±] have been observed by more than two experimental groups.
- Especially, LHCb observation of $Z_b(10610)$ [±] and $Z_b(10650)$ [±] is desirable.
- Measured quantum numbers of the exotic mesons were all J^P=1⁺, Why?

Summary of experimental status of exotic mesons (2)

• BESIII observations in 2014

 $Z_c(3900)^{\pm} \to (D\bar{D}^*)^{\pm}$ $Z_c(4025)^{\pm} \to (D^*\bar{D}^*)^{\pm}$

are interesting. Both states are about 10 MeV above the corresponding threshold. How about $Z_b(10610)^{\pm} \rightarrow (B\bar{B}^*)^{\pm}$?

Summary of experimental status of exotic mesons (3)

- What does the Argand diagram tell us about the structure of the exotic hadrons?
- Further theoretical and experimental studies are necessary.

X(3872) as charmonium-hadronic molecule hybrid (1)

• Our picture of X(3872)

Two-meson molecule with a cc̄ core: cc̄ - D⁰D̄^{*0} - D⁺D⁻* - J/ψω – J/ψρ ω and ρ have width.

J/ $\psi \omega$ and J/ $\psi \rho$ couple to $c\bar{c}$ only via DD̄* channels (OZI).

X(3872) as charmonium-hadronic molecule hybrid (2)

M. Takizawa and S. Takeuchi, Prog. Theor. Exp. Phys. 2013, 0903D01 S.Takeuchi, K.Shimizu, and M.Takizawa, Prog. Theor. Exp. Phys. 2014, 123D01

> 「チャームハドロンの構造と相互作用」KEK東海キャンパス 2015/8/6

X(3872) as charmonium-hadronic molecule hybrid (3)

- Coupling between cc^{bar} core and DD*^{bar} gives rise to attraction between D and D*^{bar}, that explains non-existence of the charged partner of X(3872).
- Existence of compact cc^{bar} component can explain production rate of X(3872) in the high-energy pp colider experiment.
- Existence of compact cc^{bar} component can explain radiative decay rates of X(3872).

Possibility of other exotic hadrons by same mechanism as X(3872)

「チャームハドロンの構造と相互作用」KEK東海キャンパス 2015/8/6

Possibility of other exotic hadrons by same mechanism as X(3872)

- There is little chance to have exotic hadrons by same mechanism as X(3872)
- X(3872) seems to be rather special

Are J/psi and psi(2S) the pure charmonia? (1)

• First of all, what is charm quark mass? $m_c (\mu^2 = m_c^2) = 1.27 \text{ GeV}$

current quark mass or constituent quark mass?

 psi(2S) -> J/psi + eta (SU(3) breaking)

Axial anomaly type decays. -> Quark triangle diagram ->light quark contents DD^{bar} contents in psi(25) and J/psi?

->or charm quark contents in pi^O and eta?

Summary

- Exotic hadron era has just started.
- From the viewpoint of the exotic hadron, we should reconsider the structure of the ordinary hadrons.

Summary

In order to understand the structure of the charged charmonium(bottomonium)-like exotic hadrons, we would like to know the interactions between D and D^{bar}, D and D^{*bar}, D^{*} and D^{*bar} (B's).

If $Z_c(3900)$ is DD^{*bar} molecule and $Z_b(10610)$ is BB^{*bar} molecule, then interaction between B and B^{*bar} should be much weaker than that between D and D^{*bar} , since the kinetic energy of BB^{*bar} system is about 1/3 of DD^{*bar} system. However, from the heavy quark symmetry these two interaction may be similar.

Back up

「チャームハドロンの構造と相互作用」KEK東海キャンパス 2015/8/6

$B^+ \rightarrow K^+ + J/\psi + \pi\pi(\pi)$

X_{c1}(1P)の影響

Schroedinger Equation

$$\begin{pmatrix} m_{c\bar{c}(1P)} - E & 0 & V & V \\ 0 & m_{c\bar{c}(2P)} - E & V & V \\ V & V & m_{D^0} + m_{D^{*0}} + \frac{\hat{p}^2}{2\mu_0} + -E & 0 \\ V & V & 0 & m_{D^*} + m_{D^{*-}} + \frac{\hat{p}^2}{2\mu_+} -E \end{pmatrix} \begin{pmatrix} c_1 | c\bar{c}(1P) \rangle \\ c_2 | c\bar{c}(2P) \rangle \\ c_3 | D^0 \overline{D^{*0}} \rangle \\ c_4 | D^+ D^{*-} \rangle \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$
$$\frac{1}{\mu_0} = \frac{1}{m_{D^0}} + \frac{1}{m_{D^{*0}}}, \quad \frac{1}{\mu_+} = \frac{1}{m_{D^+}} + \frac{1}{m_{D^{*-}}}$$

「チャームハドロンの構造と相互作用」KEK東海キャンパス 2015/8/6

X_{c1}(1P)の影響

- Charge conjugation + state is assumed
- Interaction: Isospin symmetric
- X_{c1}(1P)-DD^{*bar}とX_{c1}(2P)-DD^{*bar}は同じ結合

$$\begin{split} &\left\langle D^{0}\overline{D^{*^{0}}}(\vec{q})\Big|V\Big|c\overline{c}:1P\right\rangle = \left\langle D^{0}\overline{D^{*^{0}}}(\vec{q})\Big|V\Big|c\overline{c}:2P\right\rangle \\ &= \frac{g\Lambda^{2}}{\vec{q}^{2}+\Lambda^{2}} = \left\langle D^{+}D^{*-}(\vec{q})\Big|V\Big|c\overline{c}:1P\right\rangle = \left\langle D^{+}D^{*-}(\vec{q})\Big|V\Big|c\overline{c}:2P\right\rangle \end{split}$$

X_{c1}(1P)の影響 計算結果: 質量

- Mass of the cc-bar core: 1P: 3.51 GeV 2P: 3.95 GeV from S. Godfrey, N. Isgur, Phys. Rev. D 32 (1985) 189.
- Cutoff Lambda = 0.5 GeV, Calculated bound states energy are 3.492 GeV and <u>3.87157 GeV</u>
- $\chi_{c1}(1P)$ mass shift by coupling to DD* is about 20MeV

「チャームハドロンの構造と相互作用」KEK東海キャンパス 2015/8/6

X_{c1}(1P)の影響 計算結果: 波動関数

$$0.5\% \qquad 11\% \\ |X(3872)\rangle = 0.071 |c\overline{c}(1P)\rangle - 0.326 |c\overline{c}(2P)\rangle \\ + 0.907 |D^0 \overline{D^{*0}}\rangle + 0.255 |D^+ D^{*-}\rangle \\ 82\% \qquad 6.5\%$$

• cc^{bar} 1P component is small.

D*D*barの影響

- 簡単のために、isospinの破れは考えない。
- χ_{C1}(2P)-DD^{*bar}結合とχ_{C1}(2P)-D^{*}D^{*bar}は同じ 値にしている。

D*D*barの影響 計算結果: 波動関数

$$30\% X(3872) = 0.557 | c\overline{c}(2P) \rangle - 0.818 | D\overline{D^*}(I=0) \rangle - 0.143 | D^*\overline{D^*}(I=0) \rangle 67\% \qquad 2\%$$

- cc^{bar}成分が増えたのは、isospin平均質量
 を使ったため、束縛エネルギーが大きく
 なったので。
- D*D*barの成分は2%と十分小さかった。
