# Outline

- **Role of  $V_{\text{tensor}}$**  in light nuclei
  - He & Li isotopes,  ${}^8\text{Be}$  with  $V_{\text{bare}}$
- Tensor Optimized Shell Model (**TOSM**)  
to describe tensor correlation.
- Unitary Correlation Operator Method (**UCOM**)  
to describe short-range correlation.

# Pion exchange interaction vs. $V_{\text{tensor}}$

$$3(\vec{\sigma}_1 \cdot \hat{q})(\vec{\sigma}_2 \cdot \hat{q}) \frac{q^2}{m^2 + q^2} = (\vec{\sigma}_1 \cdot \vec{\sigma}_2) \frac{q^2}{m^2 + q^2} + S_{12} \frac{q^2}{m^2 + q^2}$$
$$= (\vec{\sigma}_1 \cdot \vec{\sigma}_2) \left[ \frac{m^2 + q^2}{m^2 + q^2} - \frac{m^2}{m^2 + q^2} \right] + S_{12} \frac{q^2}{m^2 + q^2}$$

Yukawa interaction

delta interaction

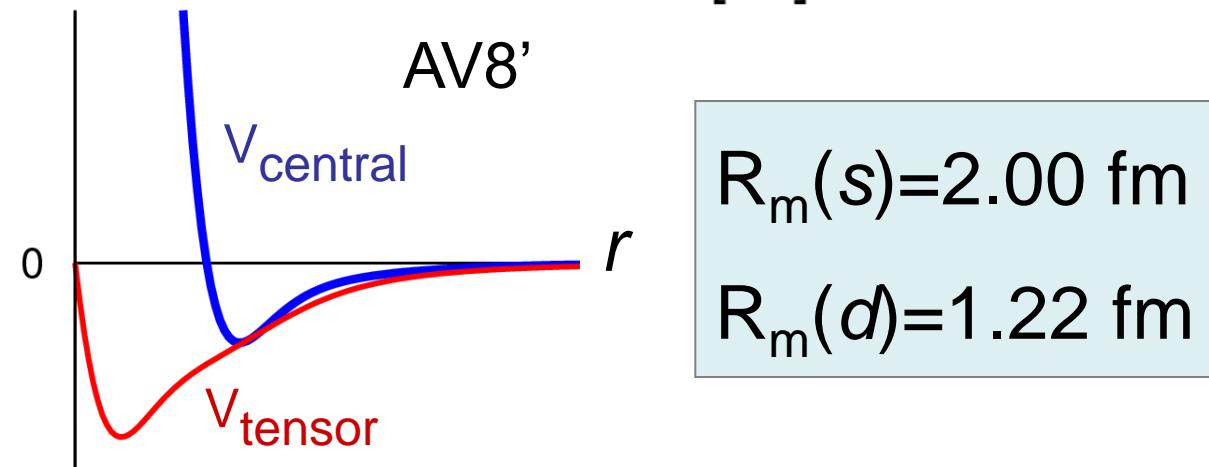

$$S_{12} = 3(\vec{\sigma}_1 \cdot \hat{q})(\vec{\sigma}_2 \cdot \hat{q}) - (\vec{\sigma}_1 \cdot \vec{\sigma}_2)$$

-  $V_{\text{tensor}}$  produces the high momentum component.

TM, Sugimoto, Kato, Toki, Ikeda PTP117(2007)257

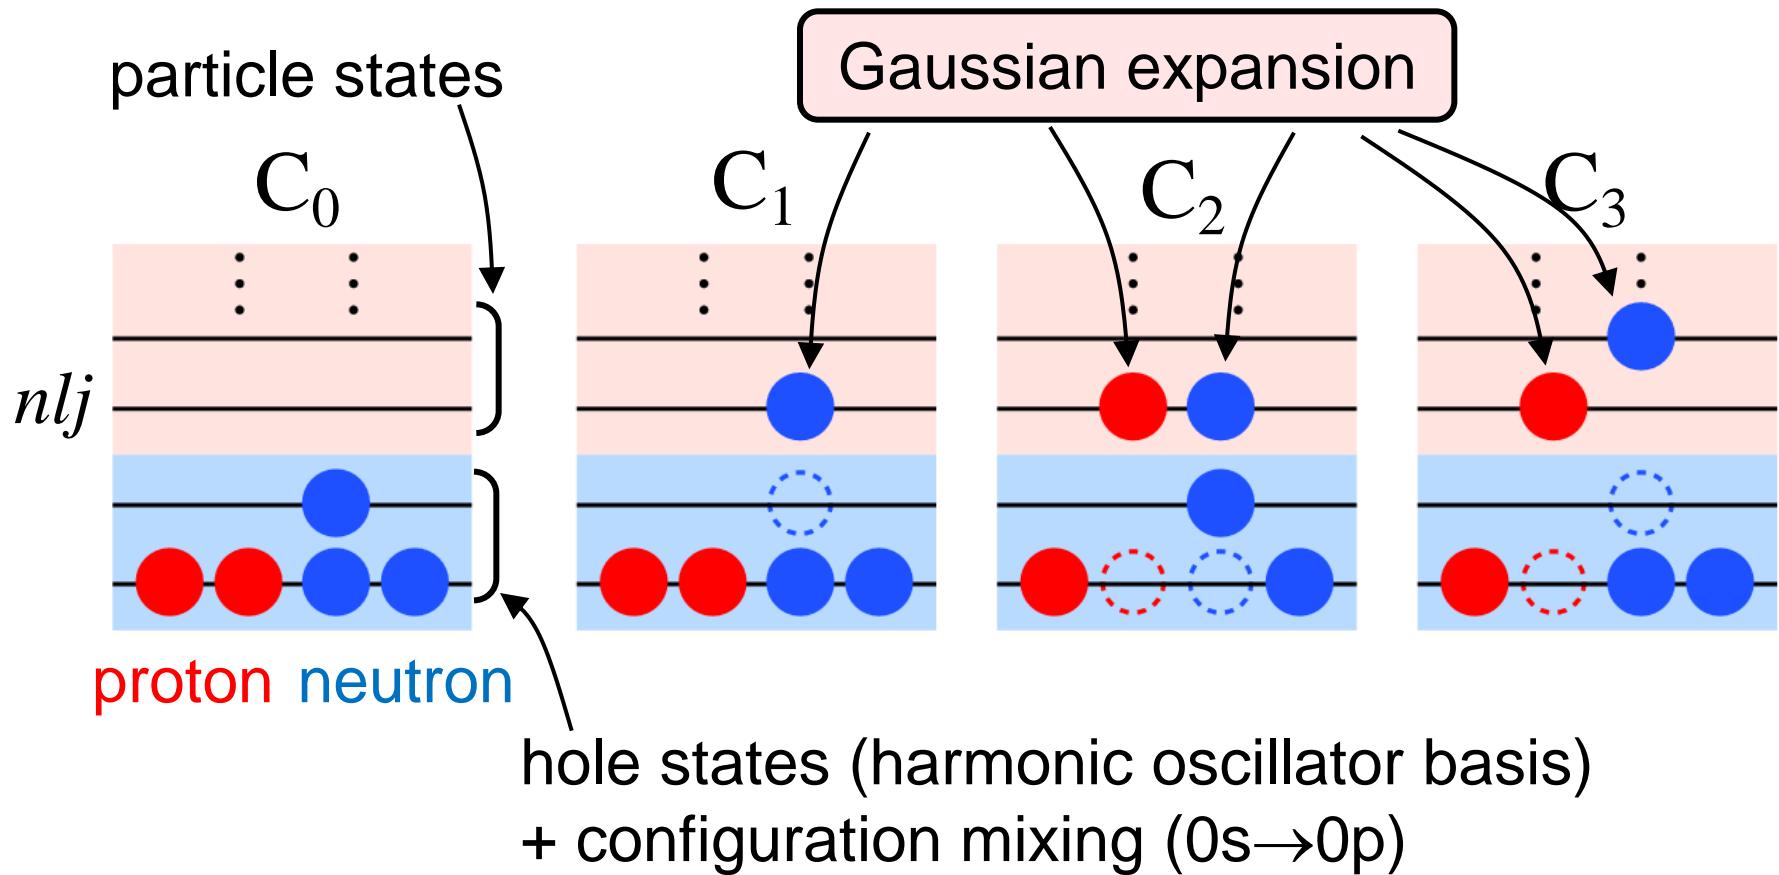

- 2p2h excitations with high- $L$  orbits.
- $V_{\text{tensor}}$  is **NOT** treated as residual interactions

cf.  $\frac{V_\pi}{V_{NN}} \sim 80\%$  in GFMC

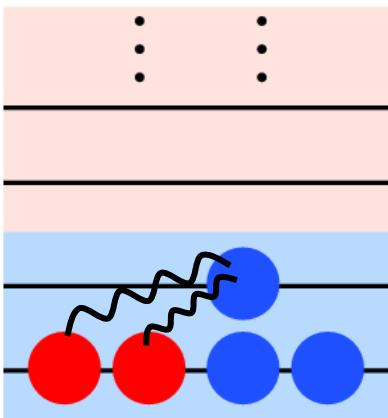

- Length parameters such as  $b_{0s}$ ,  $b_{0p}$ , ... are optimized **independently**, or **superposed by many Gaussian bases**.
  - Spatial shrinkage of **D-wave** as seen in deuteron.  
HF (Sugimoto, NPA740), RMF (Ogawa, PRC73), AMD (Dote et al., PTP115)
- Satisfy few-body results with Minnesota central force ( ${}^4, {}^6\text{He}$ )

## – Minnesota –

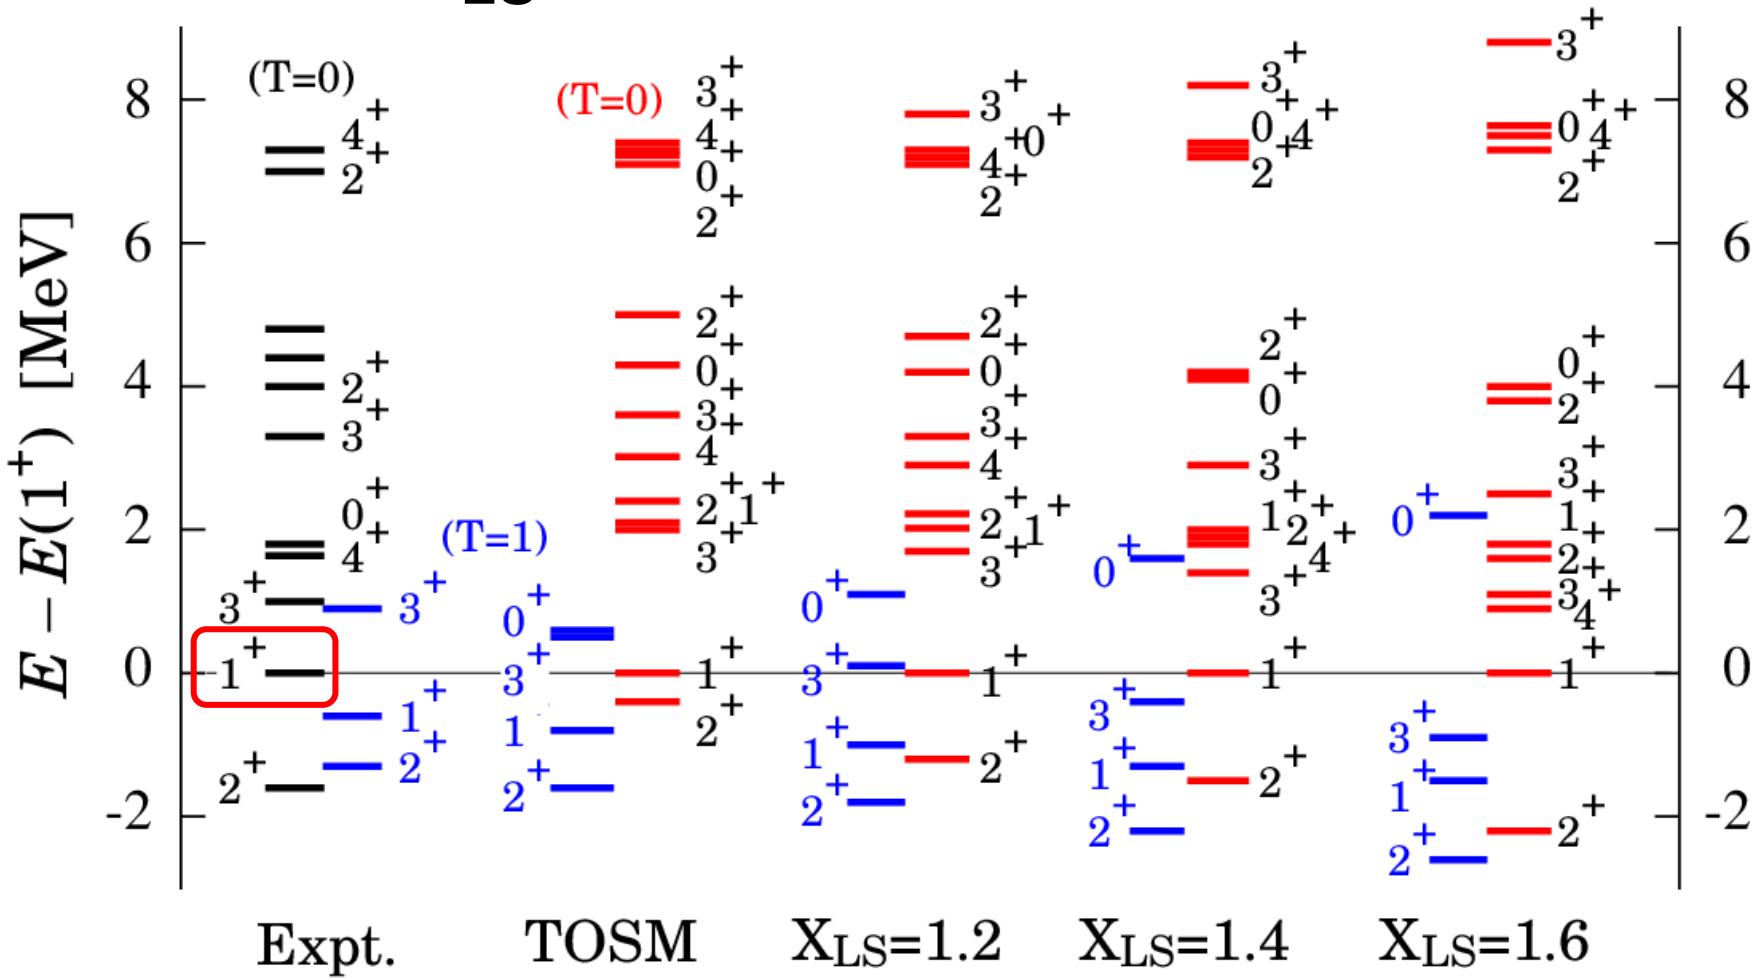

- ground band
- highly excited states
  - good  $E_x$
  - incorrect level order  $(0^+, 1^+, 3^+)$
  - $E_x(\text{T=0}) < E_x(\text{T=1})$

# $V_{\text{tensor}}$ dependence of ${}^8\text{Be}$

- S-wave UCOM can be simulated with  $X_T \sim 1.1$  (PTP121)
- Stronger tensor correlation in **T=0 states** than T=1 states.

# $V_{LS}$ dependence of ${}^8\text{Be}$

- UCOM underestimates  $\langle LS \rangle$  due to the lack of three-body term.
- Spectrum gets wider ( $2^+, 1^+, 3^+$ ), same trend in  $T=0$  &  $T=1$ .

# Summary

- **TOSM+UCOM** using  $V_{\text{bare}}$ .
  - Strong tensor correlation from 0p0h-2p2h.
- He & Li isotopes
  - Energy spectra, Radius
  - ${}^4\text{He}$  contains “***pn-pair of  $p_{1/2}$*** ” due to  $V_T$ .
- ${}^8\text{Be}$ ,  $T=0$  &  $T=1$ .
  - Two aspects : Grand band states & highly excited states.
  - Indication of more configurations such as 4p4h to describe  $2\alpha$  structure in the grand band states.
